confirmatory structural model

Table 1. Measurement model (CFA loadings)

Construct → Item	B	SE	z	p	Std. loading
visual → x1	1.00	0.00	0	<.001	
visual → x2	0.55	0.14	3.97	<.001	
visual → x3	0.73	0.15	4.85	<.001	
textual → x4	1.00	0.00	0	<.001	
textual → x5	1.11	0.07	16.50	<.001	
textual → x6	0.93	0.06	14.80	<.001	
speed → x7	1.00	0.00	0	<.001	
speed → x8	1.18	0.15	7.90	<.001	
speed → x9	1.08	0.38	2.82	.005	

Table 2. Reliability & validity

Construct	CR	AVE	ω	α
visual	.61	.37	.61	.63
textual	.89	.72	.89	.88
speed	.69	.42	.69	.69

Table 3. Fit indices

χ^2 (df, p)	χ^2/df	CFI	TLI	RMSEA [90% CI]	SRMR
85.31 (24, <.001)	3.55	.93	.90	.09 [.07, .11]	.07

Table 4. Structural paths

Path	B	SE	z	p	Std. β	95% CI	R^2
visual → textual	0.50	0.10	5.15	<.001		[.31, .61]	.21
textual → speed	0.05	0.06	0.97	.333		[−.08, .25]	.23
visual → speed	0.30	0.08	3.74	<.001		[.20, .66]	.23

Table 5. Indirect effects (mediation)

Path	Estimate	SE	boot 95% CI	p
visual → textual → speed	0.03	0.03	[-0.03, 0.09]	.346

Tables shown follow the pipeline stages you ran (EFA → CFA → fit → structural); if EFA was deselected, Tables 1–2 are omitted; if the structural stage was deselected, Tables 6–7 are omitted. Good-fit guidelines (Hu & Bentler, 1999; Marsh, Hau & Wen, 2004): CFI/TLI ≥ .95, RMSEA ≤ .06 [90% CI], SRMR ≤ .08 — guidelines, not pass/fail gates; RMSEA is unstable at small df / small N, so interpret it cautiously for compact models. Use WLSMV for ordinal indicators. R^2 is filled once per endogenous (outcome) construct. When the model is saturated (df = 0, e.g. a just-identified path model), the fit-indices table is suppressed and a saturation flag is shown. EFA on the same sample is exploratory — treat it as a diagnostic, not confirmatory evidence. The indirect-effects table appears only when the drawn structural paths form a chain (X → M → Y); each indirect effect is a lavaan defined effect with a bootstrapped 95% CI. Moderation is planned for a later version.

How to read this test

First confirm the measurement model (loadings high, CR/AVE adequate) and overall fit indices. Then read the structural paths: each std. β with p/CI is a hypothesized relationship between constructs; R^2 shows variance explained in each outcome construct. CB-SEM is confirmatory: the measurement model must be specified from theory a priori — any post-hoc respecification (e.g. from modification indices) is exploratory, must be reported as such, and ideally cross-validated on a fresh sample.

APA template: The model fit well (CFI=__, RMSEA=__, SRMR=__); the path from X to Y gave β=__, p=__.
