

1 Welch's ANOVA

Group	N	M	SD
control	20	32.48	7.47
drug_a	20	33.84	6.91
drug_b	20	37.81	7.79

F	df1	df2	p
2.58	2	37.90	.089

Pair	Mdiff	padj	95% CI
control - drug_a	-1.37	.820	[-6.92, 4.18]
control - drug_b	-5.33	.082	[-11.22, 0.55]
drug_a - drug_b	-3.96	.218	[-9.65, 1.72]

A one-way ANOVA that relaxes the equal-variance assumption but still assumes roughly normal data within each group. A significant F means at least one group mean differs from the others; the Games-Howell post-hoc (also variance-robust) then shows which specific pairs differ. Your significance threshold (α) is 0.05.

Welch's ANOVA gave $F(2,37.90)=2.58$, $p = .089$.
