01 • MANN-WHITNEY U

nonparametric two-group comparison

Table 1. Rank summary

Group	N	Mean rank	Median	IQR	Sum of ranks
control	6	3.50	70.50	3.25	21.00
treatment	6	9.50	82.00	5.00	57.00

Table 2. Mann-Whitney test

U	Z	p	r [95% CI]
0	-2.88	.002	-1.00 [-1.00, -1.00]
Hodges-Lehmann median difference = -12.00, 95% CI [-17.00, -7.00]			

r is the rank-biserial effect size. The Hodges-Lehmann estimate is the median of all between-group score differences (a location shift); its CI is from the same wilcox.test.

Figure. Distribution by group

How to read this test

The nonparametric counterpart to the independent t-test, comparing whole distributions via ranks rather than means. A p below alpha means one group's values tend to be systematically higher or lower

(stochastic dominance) — this equals a difference in medians only when the two groups have similar distribution shapes. r gives the effect size. Your significance threshold (α) is 0.05.

APA template: A Mann-Whitney U test gave $U=0$, $Z=-2.88$, $p = .002$, $r=-1.00 [-1.00, -1.00]$.
