01 • FRIEDMAN

nonparametric repeated measures

Table 1. Rank summary

Condition	Mean rank
score_t1	1.23
score_t2	2.04
score_t3	2.73

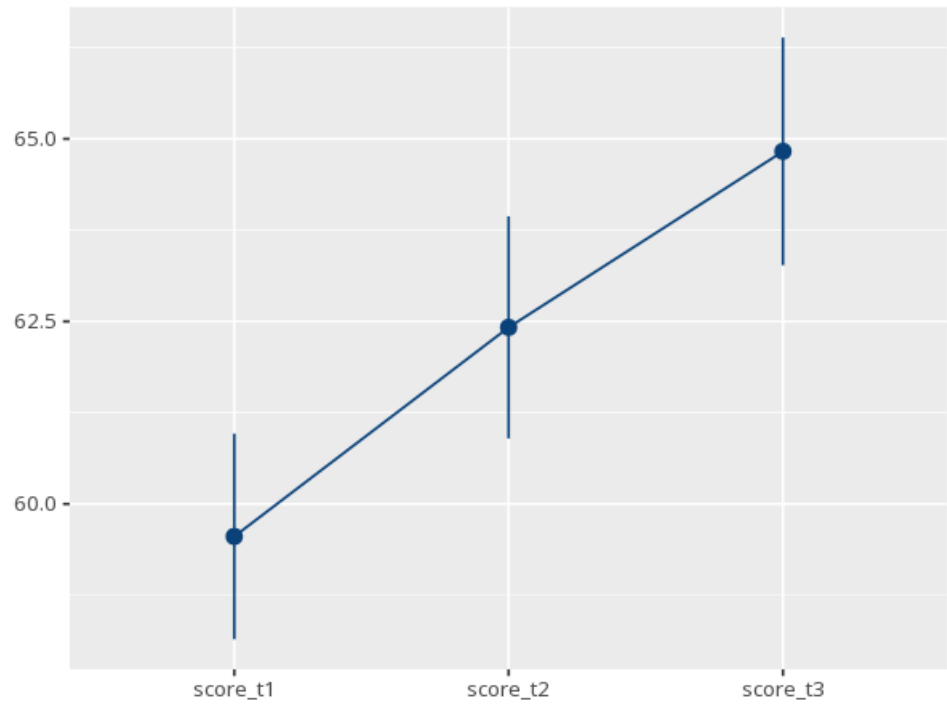

Table 2. Friedman test

χ^2	df	p	Kendall's W [95% CI]
67.19	2	<.001	0.56 [0.48, 1.00]

Table 3. Post-hoc (Nemenyi)

Pair	P _{adj}
score_t1 - score_t2	<.001
score_t1 - score_t3	<.001
score_t2 - score_t3	<.001

Figure. Across conditions

How to read this test

The nonparametric counterpart to repeated-measures ANOVA. The χ^2/p tests whether ranks differ across conditions; Kendall's W is the effect size (0–1 agreement). Post-hoc shows which conditions differ. Your significance threshold (α) is 0.05.

APA template: A Friedman test gave $\chi^2(2)=67.19$, $p < .001$, $W=.56$ [.48, 1.00].
