01 • FIXED EFFECTS

panel regression, entity effects

Table 1. Coefficients (within estimator)

	(1)
leverage	-5.57 (1.47) [-8.49, -2.66]
rd_spend	1.89 (0.74) [0.41, 3.37]
size	0.14 (0.43) [-0.71, 0.99]
Num.Obs.	96
N entities	12
Within R ²	.91
Adj. within R ²	.90
F-test	F(3, 81) = 288.78, p < .001

time-invariant predictors are absorbed by the entity effects and drop out; a predictor must also change within entities over time to be estimable — predictors with little within-entity variation give large standard errors and unreliable estimates. Standard errors in parentheses are clustered by entity; the bracketed line is the 95% CI. F-test for individual effects (poolability): F = 1.29, p = .244 — a low p favours the entity effects over pooled OLS.

Figure. Coefficients

How to read this test

Each B is the within-entity effect of a predictor, controlling for everything stable about each entity. p and the clustered CI assess it; within R^2 is the variance explained by the time-varying predictors. Method: R plm package (Croissant & Millo, 2008). Your significance threshold (α) is 0.05.

APA template: In a fixed-effects model, predictor leverage gave $B=-5.57$, $p < .001$ (clustered SE).
