01 • AVERAGE VARIANCE EXTRACTED (AVE)

convergent and discriminant validity

Table 1. Convergent validity

Construct	AVE	CR	ω	α
visual	.37	.61	.61	.63
textual	.72	.89	.89	.88
speed	.42	.69	.69	.69

Table 2. Discriminant validity (Fornell–Larcker)

	visual	textual	speed
visual	.61		
textual	.46	.85	
speed	.47	.28	.65

Table 3. Discriminant validity (HTMT)

	visual	textual	speed
visual			
textual	.38		
speed	.39	.28	

AVE ≥ .50 indicates adequate convergent validity; computed from the CFA loadings (Fornell & Larcker, 1981). CR ≥ .70 acceptable (Nunnally, 1978; Bagozzi & Yi, 1988); do not cite CR ≥ .70 to Fornell & Larcker. ω (McDonald's) is the preferred reliability coefficient — model-based, not assuming tau-equivalence (McNeish, 2018); α is retained as a secondary/legacy column. Fornell–Larcker: diagonal = √AVE (bold); off-diagonal = inter-construct latent correlations. HTMT < .85 indicates discriminant validity for conceptually distinct constructs (Henseler, Ringle & Sarstedt, 2015). When only 1 construct is defined, Tables 2 and 3 are suppressed (discriminant validity requires ≥ 2 constructs). Applies to reflective constructs only.

Figure. Validity overview

How to read this test

AVE (Average Variance Extracted) is the average share of item variance a construct captures; $\geq .50$ means items converge on their construct (Fornell & Larcker, 1981). CR (Composite Reliability) $\geq .70$ indicates acceptable construct reliability. ω (McDonald's omega) is the preferred headline reliability coefficient; α (Cronbach's) is shown as a secondary/legacy coefficient. For discriminant validity, Fornell-Larcker (Table 2): each construct's $\sqrt{\text{AVE}}$ (bold diagonal) should exceed its correlations with other constructs. HTMT (Table 3): values $< .85$ support discriminant validity for conceptually distinct constructs — use HTMT as the primary criterion and Fornell-Larcker as a legacy check. $\text{AVE} < .50$ may still be acceptable when $\text{CR} > .60$ (F&L caveat), but treat this as a caution, not a lenient pass. All cutoffs are heuristics, not pass/fail gates. Applies to reflective constructs only.

APA template: Convergent validity was supported, all AVE $\geq .50$ and CR $\geq .70$; discriminant validity held, all HTMT $< .85$.
