education_spend	0.15 (0.16) [−0.18, 0.47]
urbanization	−0.03 (0.02) [−0.06, 0.01]
Num.Obs.	100
N entities	10
Within R ²	.44
Adj. within R ²	.36
Between R ²	1.00
Overall R ²	.90
F-test	$F(3, 87) = 22.81, p < .001$

Each B is the within-entity effect of a predictor, controlling for everything

stable about each entity. p and the clustered CI assess it; within R^2 is the variance explained by the time-varying predictors. Method: R plm package (Croissant & Millo, 2008). Your significance threshold (α) is 0.05.

In a fixed-effects model, predictor investment gave $B=0.13$, $p = .003$ (clustered SE).

Statistical basis: Fixed-effects (within) panel estimator (Croissant, Y., Millo, G. (2008). "Panel Data Econometrics in R: The plm Package." *Journal of Statistical Software*, 27(2), 1-43.).
