01 · SPEARMAN CORRELATION

rank association (ordinal / monotonic)

Table. Spearman correlation

Pair	ρ [95% CI]	S	p	N
satisfaction – motivation	0.85 [0.76, 0.90]	1632.68	<.001	40

ρ CI from a seeded percentile bootstrap (2000 resamples); cor.test does not return one for rank correlation.

Figure. Relationship

Understanding the numbers

ρ (rho). The strength and direction of the monotonic (consistent up-or-down) relationship between the two variables, from -1 to +1. Here, $\rho = 0.85$, 95% CI [0.76, 0.90] - read the sign and magnitude like Pearson's r : a large positive relationship.

S. The test statistic Spearman's rho is derived from, based on the sum of squared rank differences. Here, $S = 1632.68$.

p. The probability of a rank association this strong (or stronger) if the two variables were truly unrelated. Here, $p < .001$ - below your significance threshold, a significant rank association.

N. How many complete (paired, non-missing) cases were used. Here, N = 40 complete pairs.

How to read this test

ρ measures how well the relationship follows a consistent up-or-down trend (monotonic), using ranks. Read sign and magnitude like Pearson's r ; p tests significance. Your significance threshold (α) is 0.05.

APA template: A Spearman correlation gave $\rho=.85$ [.76, .90], $p < .001$, $N=40$.

Statistical basis: Spearman's rank correlation (ρ) (Spearman, C. (1904). "The proof and measurement of association between two things." American Journal of Psychology, 15(1), 72-101.). Full references in the exported CITATIONS.txt.
