

1 Kendall's tau

Pair	τ_b [95% CI]	z	p	N
satisfaction – motivation	0.75 [0.66, 0.82]	5.71	<.001	40

τ (Kendalls tau-b) is a rank correlation based on concordant vs. discordant pairs, with a correction for ties — well suited to small samples and many ties. Sign = direction, magnitude = strength; p tests significance. Your significance threshold (α) is 0.05.

A Kendall's tau-b correlation gave $\tau=.75$ [.66, .82], $p < .001$, $N=40$.

Statistical basis: Kendall's tau-b rank correlation (tie-corrected) (Kendall, M. G. (1938). "A new measure of rank correlation." *Biometrika*, 30(1/2), 81-93.).
